Contents

Probability Graphical Model

Importance:

- A rich framework to encode factorization and independence over random variables
- Wide applications: medical diagnosis, image understanding, speech recognition, and natural language processing

SUSTech

Weaknesses of Traditional PGMs

Traditional PGMs:

- Bayesian network
- Markov random field

Weaknesses:

1. Complexity scales unproportionally
2. Approximate learning
3. Intractability
4. Separation of learning and inference

SUSTech

Advantages of SPN

Why SPN:

1. Complexity scales up linearly
2. Exact learning
3. Tractability
4. Combination of learning and inference

SUSTech

What is SPN

Sum-product network(SPN):

- Graph type: DAG
- Leaves: random variables
- Internal node: sum node, product node
- Root: sum node
- Network polynomial: $f_{\mathcal{S}}(\mathbf{X}) = \sum_{X \in \mathbf{x}} \Phi(X) \prod_{X \in \mathbf{x}} (X)$

SUSTech

Example

Figure: An Example of SPN

A: Rain $\overline{A}$: No rain
B: Thunder $\overline{B}$: No thunder

$f_{\mathcal{S}}(A, B, \overline{A}, \overline{B})$

$=0.15(0.6A + 0.4\overline{A})(0.2B + 0.8\overline{B})$

$+0.85(0.6A + 0.4\overline{A})(0.5B + 0.5\overline{B})$

$=0.273AB + 0.327A\overline{B} + 0.182\overline{A}B$

$+0.218\overline{AB}$

Query: P(rain + thunder) = ?

$$f_{\mathcal{S}}(1, 1, 0, 0) = 0.273$$

SUSTech

Learning Methods

Learning:

- Structure learning:
    - Poon-Domingos Architecture: Rectangle regions
    - Dennis-Venture Architecture: Any shape regions
- Parameter learning:
    - Gradient method: maximize log-likelihood
    - EM algorithm: introduce latent variables, inference in E-step, update weights in M-step

SUSTech

Inference Methods

Differential approach:

1. Compute the marginal distribution via network polynomials
2. Interpret the probability distribution through derivatives

Goal

Use SPN to learn on one half of an image and inference the other half.

SUSTech

Enviroment

Enviroment:

- Platform: TaiYi
- Library: OpenMPI C++
- Dataset:
  - **Caltech**:
    - 101 categories, from 40 to 800 images per category
    - about 300×200 pixels, rescaled to 100×64 pixels
  - **Olivetti**:
    - face images taken between Apr. 1992 and Apr. 1994 at AT&T Laboratories Cambridge
    - size 64×64 pixels

SUSTech

Process

Process:

1. Read image data from dataset
2. Construct SPN on data via the method combining both learning and inference
   - Generative learning
   - Differential approach
3. Save model for completion
4. Read model and use model to complete image, then output to save
5. Evaluate results and compute the MSE
SUSTech

Poon-Domingos Architecture

Figure: Poon-Domingos Architecture

Experiments

Experiments:

1. **Caltech**: 80 cores, **Olivetti**: 40 cores, size 64×64
2. **Caltech**: 120 cores, **Olivetti**: 80 cores, size 64×64
3. **Caltech**: 80 cores, size 100×64
4. **Caltech**: 120 cores, size 100×64

Poon's experiments: **Caltech**: 102 cores, **Olivetti**: 51 cores, size 64×64

Figure: Exp. #2 vs Exp. #4(Caltech)

Comparison on Image(1)

Figure: Airplanes-bottom(Poon's, Exp. #2, Exp. #4)

Figure: Yin_yang-left(Poon's, Exp. #2, Exp. #4)
SUSTech

Comparison on Image(2)

Figure: Pyramid-bottom(Poon's, Exp. #2, Exp. #4)

Figure: Sunflower-bottom(Poon's, Exp. #2, Exp. #4)

SUSTech

Comparison on Time

Time Cost	Poon's	Exp. #1	Exp. #2	Exp. #3	Exp. #4
Caltech-101	≤ 2 hours	≤ 4 hours	≤ 7 hours	≤ 11 hours	≤ 19 hours
Olivetti	within a few minutes	≤ 4 minutes	≥ 72 hours	Nan	Nan

Table: Time Cost of Poon's Experiments and My Experiments

SUSTech

Analysis

Conclusion:

- Number of cores makes no influence
- Larger input size leads to lower MSE
- My implementation is valid

Why:

- Randomness in architecture
- Difference between implementation
- Complexity of model

SUSTech

Conclusion

Conclusion:

- My implementation is valid and the reproduction is successful
- Reproduction is not easy

SUSTech

Future Work

Future work:

1. Architecture improvement
2. More applications
3. New algorithms for learning and inference
